

Outside Track

The main idea is that ***an outside tracker manager*** is built by recording the tracking results generated by some (**maybe more than one**) existed trackers, and **using reasoning to combine all the information**.

What's good is that no matter what is the existed tracker used, if they can generate the result in a designated format, they can be considered together.

The followings are the global view of the position of the outside tracker in CiscoDeepVision and the pipeline of the outside tracker.
